NEW QUESTION: 1

Ziehen Sie die Beschreibungen von links auf die Konfigurationsverwaltungstechnologien rechts.

Ansible:

- Verwendet SSH für die Remote-Gerätekommunikation
- verwendet YAML für grundlegende Konfigurationselemente

Koch:

- Verwendet den TCP-Port 10002 für Konfigurations-Push-Jobs
- verwendet Ruby für grundlegende Konfigurationselemente

Marionette:

- Grundlegende Konfigurationselemente werden in einem Manifest gespeichert
- verwendet TCP 8140 für die Kommunikation

Der Fokus von Ansible liegt darauf, rationalisiert und schnell zu sein und keine Installation des Node Agent zu erfordern.

Somit führt Ansible alle Funktionen über SSH aus. Ansible basiert auf Python, im Gegensatz zur Ruby-Stiftung von Puppet and Chef.

Der TCP-Port 10002 ist der Befehlsport. Es kann in der Konfigurationsdatei von Chef Push Jobs konfiguriert werden.

Über diesen Port können Chef Push Jobs-Clients mit dem Chef Push Jobs-Server kommunizieren.

Puppet ist eine Open-Source-Konfigurationsverwaltungslösung, die mit Ruby erstellt wurde und benutzerdefinierte Vorlagen für domänenspezifische Sprache (DSL) und eingebettete Ruby (ERB) zum Erstellen benutzerdefinierter Puppet-Sprachdateien bietet, die einen Programmieransatz für deklarative Paradigmen bieten.

Ein Puppet-Code wird als Manifest bezeichnet und ist eine Datei mit der Erweiterung .pp.

Answer:

Explanation:

RAID-0 is known as striping. It is not a fault tolerant solution but does improve disk performance for read/write operations. Striping requires a minimum of two disks and does not use parity.

RAID-0 can be used where performance is required over fault tolerance, such as a media streaming server.

RAID-1 is known as mirroring because the same data is written to two disks so that the two disks have identical data. This is a fault tolerant solution that halves the storage space. A minimum of two disks are used in mirroring and does not use parity. RAID-1 can be used where fault tolerance is required over performance, such as on an authentication server. RAID-5 is a fault tolerant solution that uses parity and striping. A minimum of three disks are required for RAID-5 with one disk's worth of space being used for parity information. However, the parity information is distributed across all the disks. RAID-5 can recover from a single disk failure.

RAID-6 is a fault tolerant solution that uses dual parity and striping. A minimum of four disks are required for RAID-6. Dual parity allows RAID-6 to recover from the simultaneous failure of up to two disks. Critical data should be stored on a RAID-6 system.
